

THE WORKFLOW, NODE BY NODE

A Webhook Verify + Respond	One-time handshake so Meta trusts your URL
1 Webhook (POST)	Front door — catches every incoming message
2 Bot Brain EDIT ME	Menu, prices, rules, tone — the one node you change
3 Parse Message	Pulls sender + text; ignores read-receipts
4 Load History	Memory — reads last 8 turns for this customer
5 Build Request	Stacks the conversation in order for the AI
6 Gemini AI	Writes the reply (auto-retries if busy)
7 Build Reply	Cleans reply + extracts the hidden order
8 Log to DB	Saves every chat (this feeds the memory)
9 Order Confirmed?	Fork: real order → save; else → just reply
10 Save Order	Writes confirmed orders to the orders table
11 Send WhatsApp	Sends the final reply back to the customer

⚠ Still to do — add 3 numbers

Meta → **WhatsApp** → **API Setup** → **Manage phone number list**. Each needs the code Meta texts to it.

1. +92 309 5595593
2. +92 324 1470624
3. +92 325 1238084

✏ Change the menu or prices

n8n → **Bot Brain** node → edit text → **Save**. Live instantly. No code.

🟢 Keep it running

Docker (n8n + Postgres) auto-restarts. Keep the tunnel open:

```
ngrok http --url=nonanarchically-rambunctious-lashay.ngrok-free.dev 5678
```

📄 See chats & orders

```
docker exec resto-postgres psql -U resto -d restobot -c "SELECT * FROM orders ORDER BY id DESC LIMIT 5;"
```

Callback URL: `https://nonanarchically-rambunctious-lashay.ngrok-free.dev/webhook/whatsapp`
